

Intelligent accommodation for Africa's university students.

From listings to better decisions.

A product by Cristedor Labs • Prepared for Google Africa Applied AI Lab • 2026

A Listing
Problem

An Intelligent Decision- Support Experience

We are turning accommodation search from a
passive directory into an active reasoning engine.

Finding student accommodation is a decision problem.

Students often have to piece together fragmented information before they can confidently choose where to live.

**Students do not simply need more listings.
They need better information, better comparison, and better decision support.**

UniStay — a smarter way to discover student housing.

The Old Way

Complex Filter Systems

Exhaustive Browsing

Guessing Fit

The UniStay Paradigm

Intelligent Discovery (Natural Language)

Students describe what they need naturally instead of learning rigid filters.

Personalized Matching

UniStay translates preferences into structured requirements to identify highly relevant options.

Clear Comparison & Trade-offs

Students evaluate options using the exact factors that matter to them with AI-surfaced evidence.

From searching to deciding — — with AI at the center.

1. Understand → 2. Match → 3. Explain → 4. Compare → 5. Decide.

A working foundation — with the intelligence layer next.

Why Google AI is strategically important to UniStay.

GEMINI

Natural-language understanding, matching, explanations, comparisons, and conversational assistance.

MULTIMODAL AI

Understand property photos, documents, and listing material to make unstructured accommodation information structurally useful.

GEMMA / FUTURE MODELS

Evaluate lightweight or specialized workflows where appropriate as the product matures.

WHY THIS FITS THE LAB: UniStay has a clear African use case where AI can transform a fragmented, information-heavy decision into a personalized, explainable experience. The goal is not a chatbot—it is materially useful AI.

How UniStay Works: A simple loop built around the student.

The more **structured** and **trustworthy** the accommodation data becomes, the more **useful** the **intelligence layer** can become.

Start in Ghana. Build for Africa.

Solving a repeatable problem
across university ecosystems for
Students, Providers, and Universities.

Students

Discover accommodation that fits budget, location, facilities, and personal preferences.

Providers

Present structured accommodation information and reach students through a focused platform.

Universities / Ecosystem

Enable better visibility into student housing needs and infrastructural gaps over time.

Build the foundation. Prove the AI. Scale the platform.

1	2	3
NOW (2026) Complete core platform Continue development, strengthen student/provider experience, and prepare for launch.	NEXT (2026–27) Build AI layer Prototype natural-language discovery, matching, explanations, and comparison using Google AI.	GROW (2027+) Expand the model Validate product in more Ghanaian university ecosystems; prepare for African expansion.

WHAT WE NEED TO VALIDATE:

Student adoption • Recommendation quality • Listing/data reliability • Provider participation • Conversion to action

Founder & Developer Dormenikpi Kwaku Precious

Software developer and entrepreneur building technology products from Ghana, with a focus on practical software and AI-enabled solutions.

Built by Cristedor Labs / Cristedor Group

VISION: To become the intelligence layer connecting African students with the places they live and study.

WHAT WE WANT TO BUILD WITH GOOGLE:

A validated, AI-native student housing experience that can move from a working foundation to a scalable African product.
